Controlled Experiments in Software Engineering

Jurgen Vinju

TCSA Day, October 28th 2011

This talk is about improving software research

- What is **software engineering**?
 - What is **software**?
 - What are the **research questions**?
 - What are the **research methods**?
- A new **empirical** research method
 - That can **isolate** causes of software quality
 - That **motivates** theoretical research in program semantics

UNDER CONSTRUCTION

Software engineering:

“The application of a systematic, disciplined, quantifiable approach to the development, operation, and maintenance of software, and the study of these approaches.” [SWEBOK]

What we have proven and/or have evidence of:

- people trump technology and methodology

- size matters

- many technical

Unsatisfactory

we do not know what matters about these recipes

- We do not know which design choices are better

“The application of a systematic, disciplined, quantifiable approach to the development, operation, and maintenance of software, and the study of these approaches.”

Solution

Reality

Quality

COmpl3x17y

Problem

“Beware of bugs in the above code; I have only proved it correct, not tried it.” —
Donald E. Knuth to Peter van Emde Boas (1977)

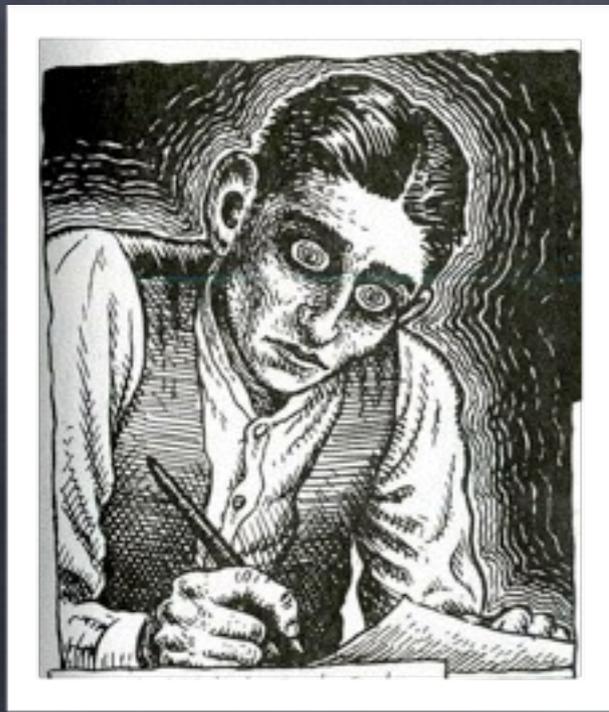

- Theoretical and empirical methods are two sides of the same medal

- Internal & external validity

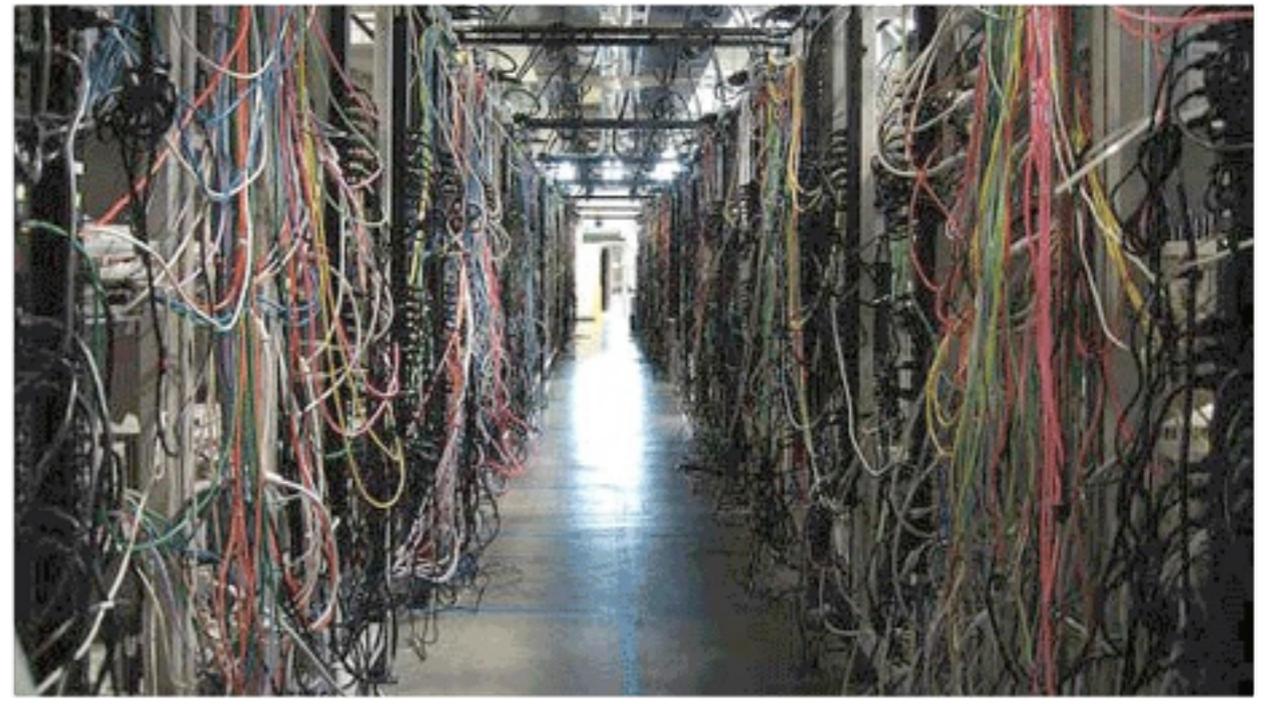

- Idea & truth

- Elegance & relevance

- *Quality* & Complexity

Kafkaesque

We study “software” – large and complex structures of computer instructions, written and read by man, executed by computers

“marked by a senseless, disorienting, often menacing complexity...” (Infoplease.com)

Size does matter

- A normal Dutch company may own 3×10^{10} lines of code - 750,000,000 single column pages.
- It goes a few times around the globe, if printed.
- At 1 minute per page (?) that might take approximately 1427 years to read.
- Ergo, nobody has ever understood it, or will ever fully understand it.

The source code of "ls"

3894 lines

367 ifs

174 cases

Research methods

Example: structured programming
theory: goto's are not needed
practice: goto's are harmful, sometimes
truth: ????

• Prototype and

not convincing

toys

• Study prog

not convincing

muddy

• Measure s

not convincing

meaningless

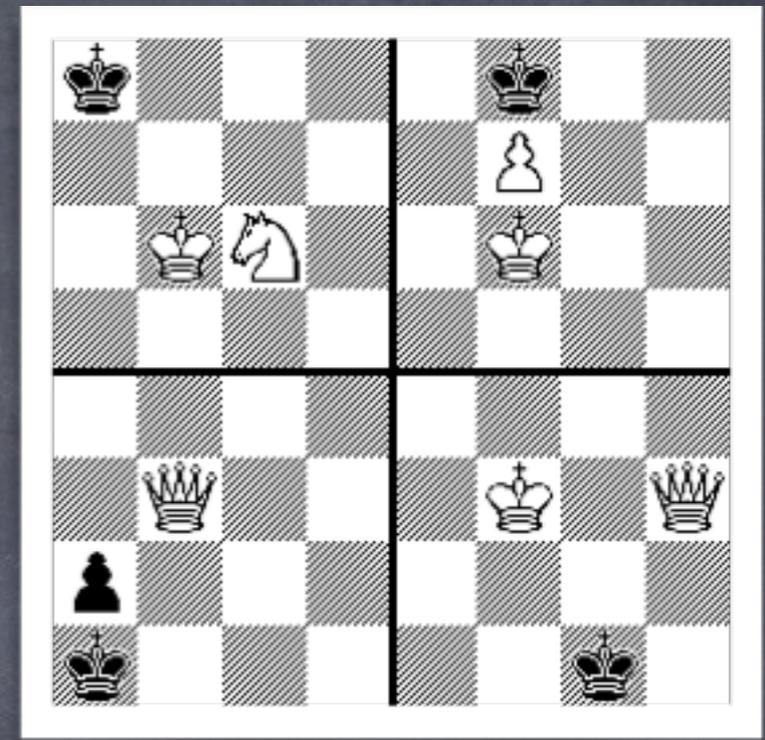

• Time will te

a

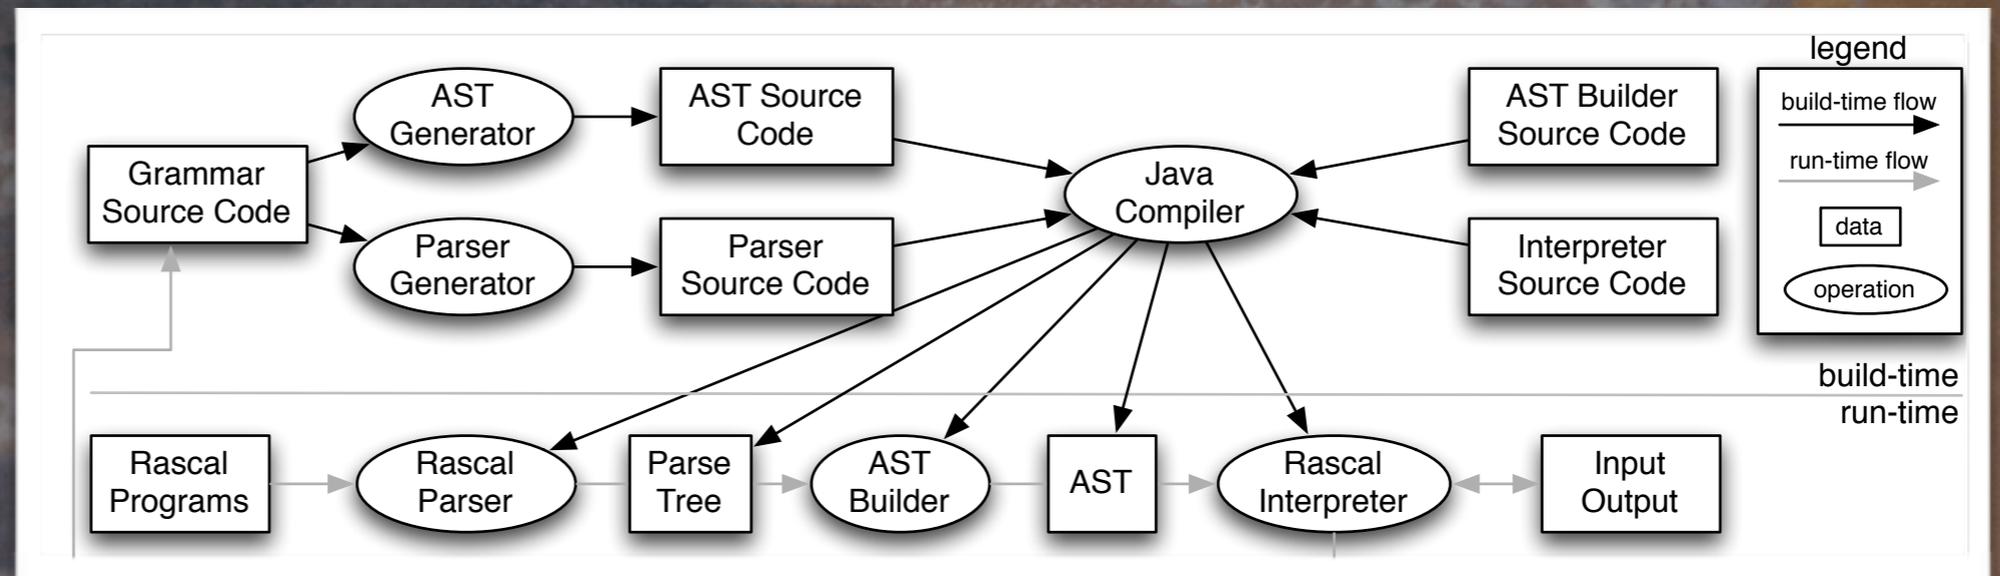

still annoying

Stalemate?

- We need to prove that our ideas work on a relevant scale, but precisely scale is what prevents us from proving anything.
- The challenges are:
 - volume
 - heterogeneity
 - plurality of factors

Case:

- Abstract syntax trees (ASTs)
- Operations on ASTs
- 400 concrete classes, 140 abstract classes
- AST classes are generated from a grammar
- Dispatch, dispatch, dispatch
- Evolution of the ± 100 kLOC java code

We compare design (patterns) to learn which is best in which situations

AST instance

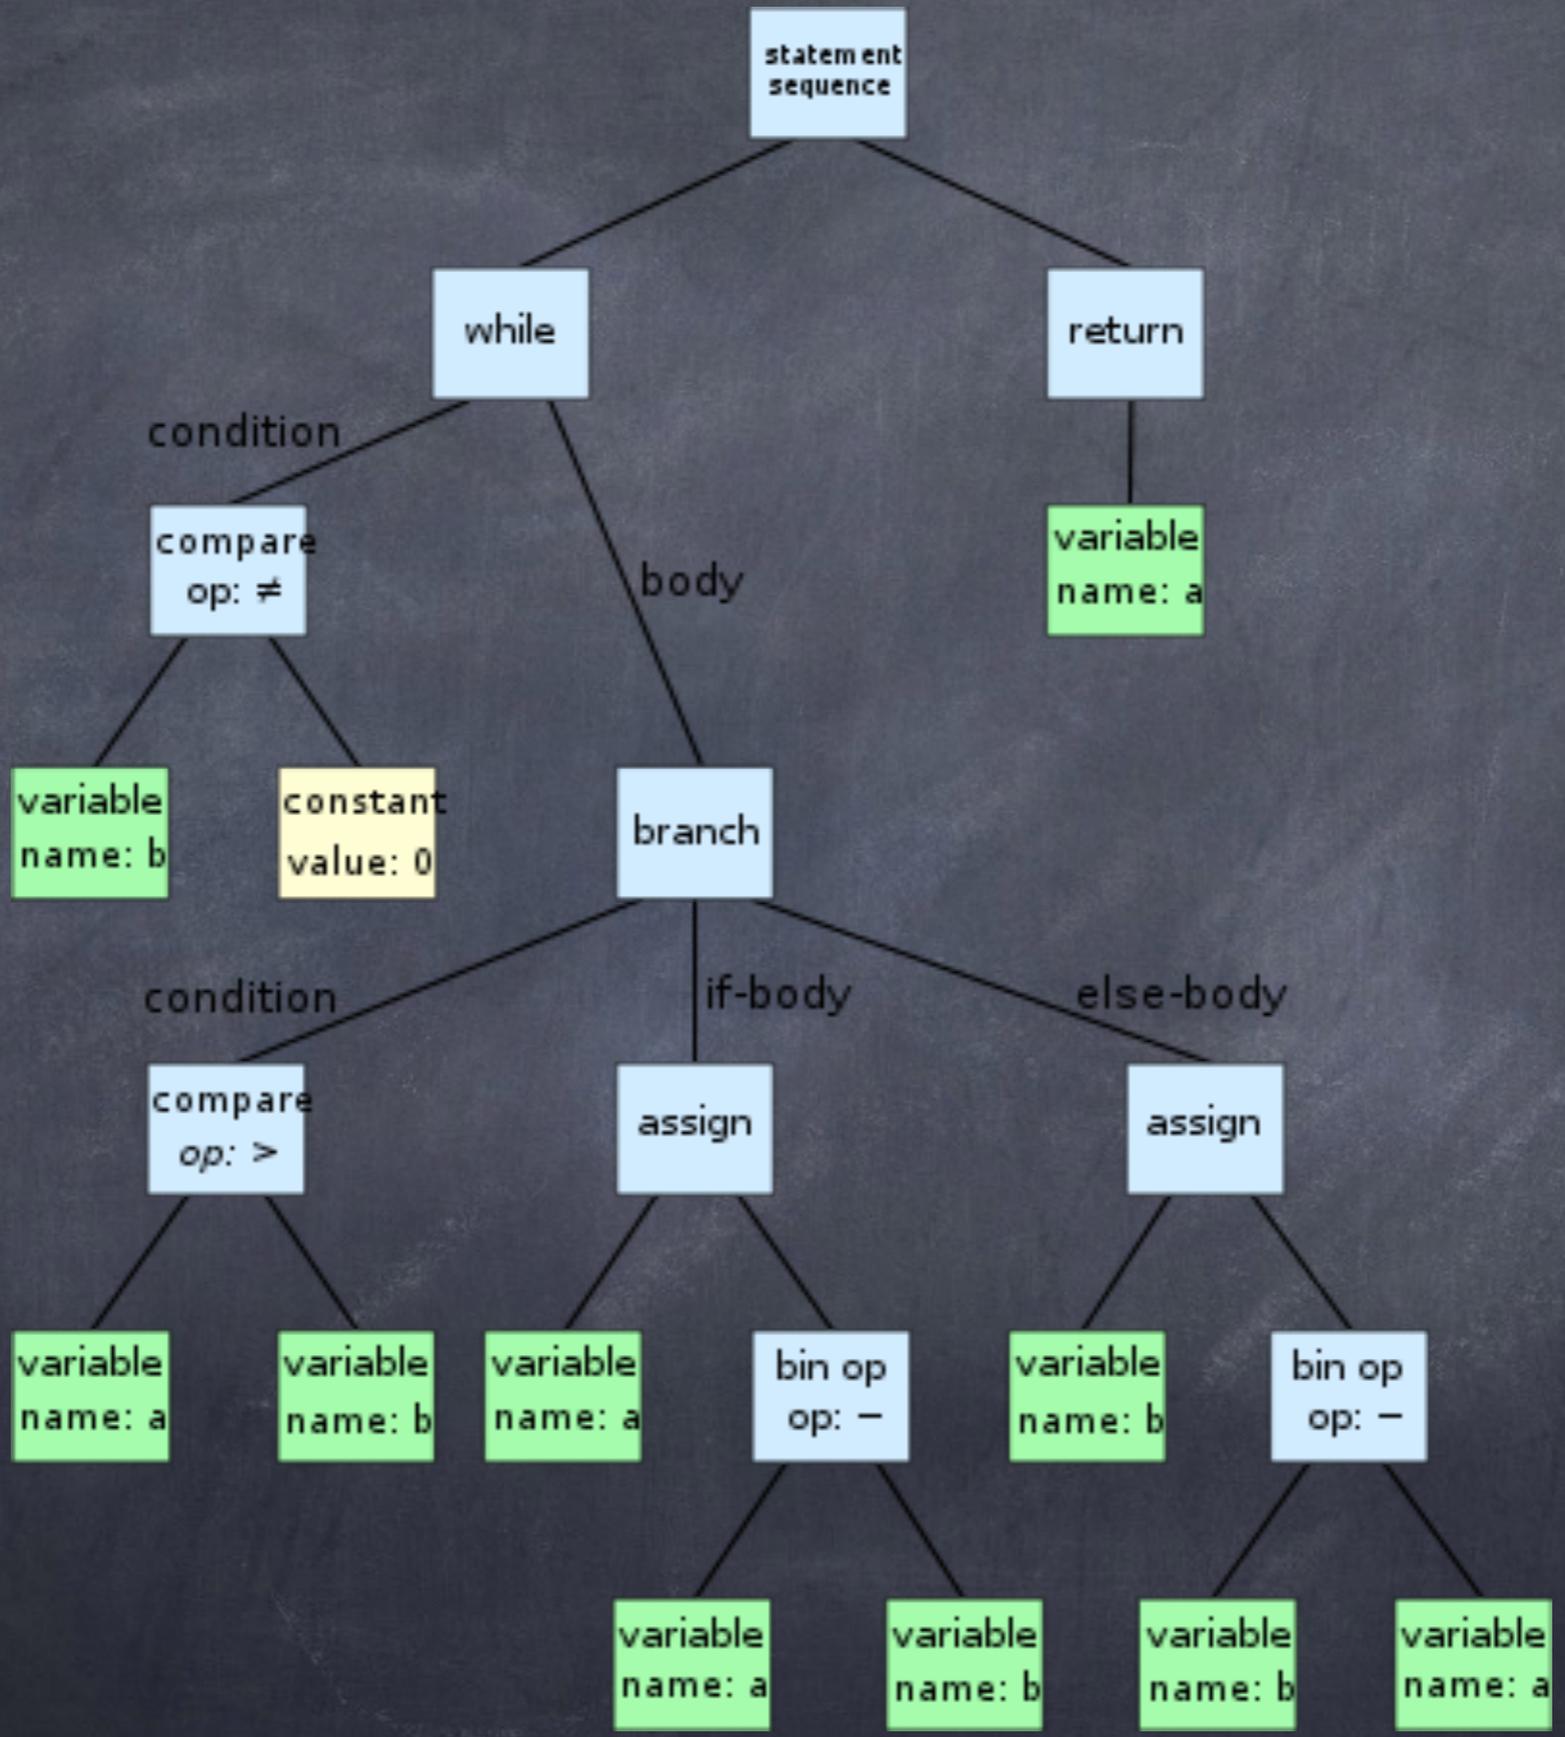

image from wikipedia.org

Composite Pattern

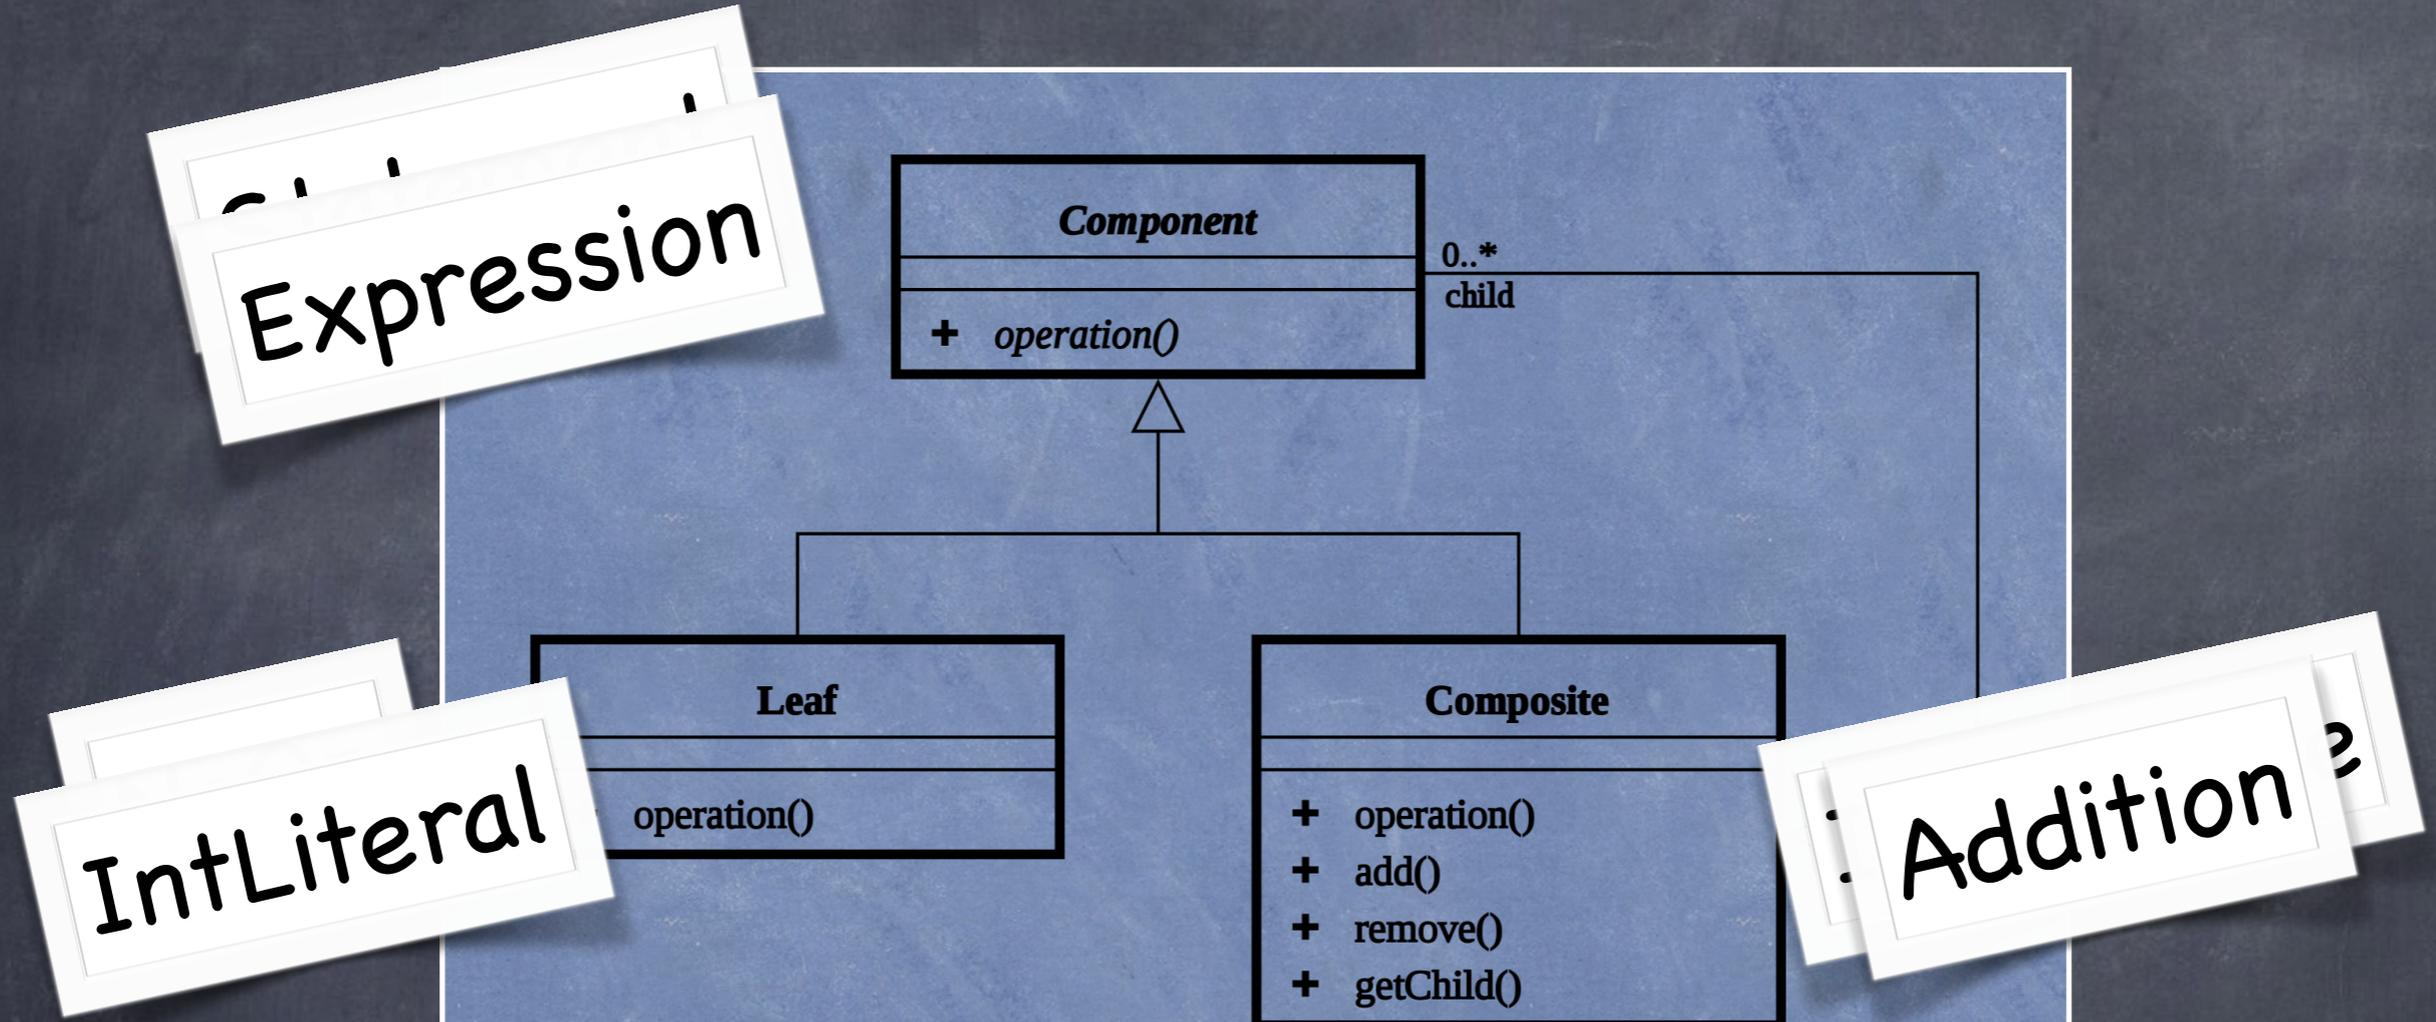

Fig. 2. The Composite Pattern³

Interpreter Pattern

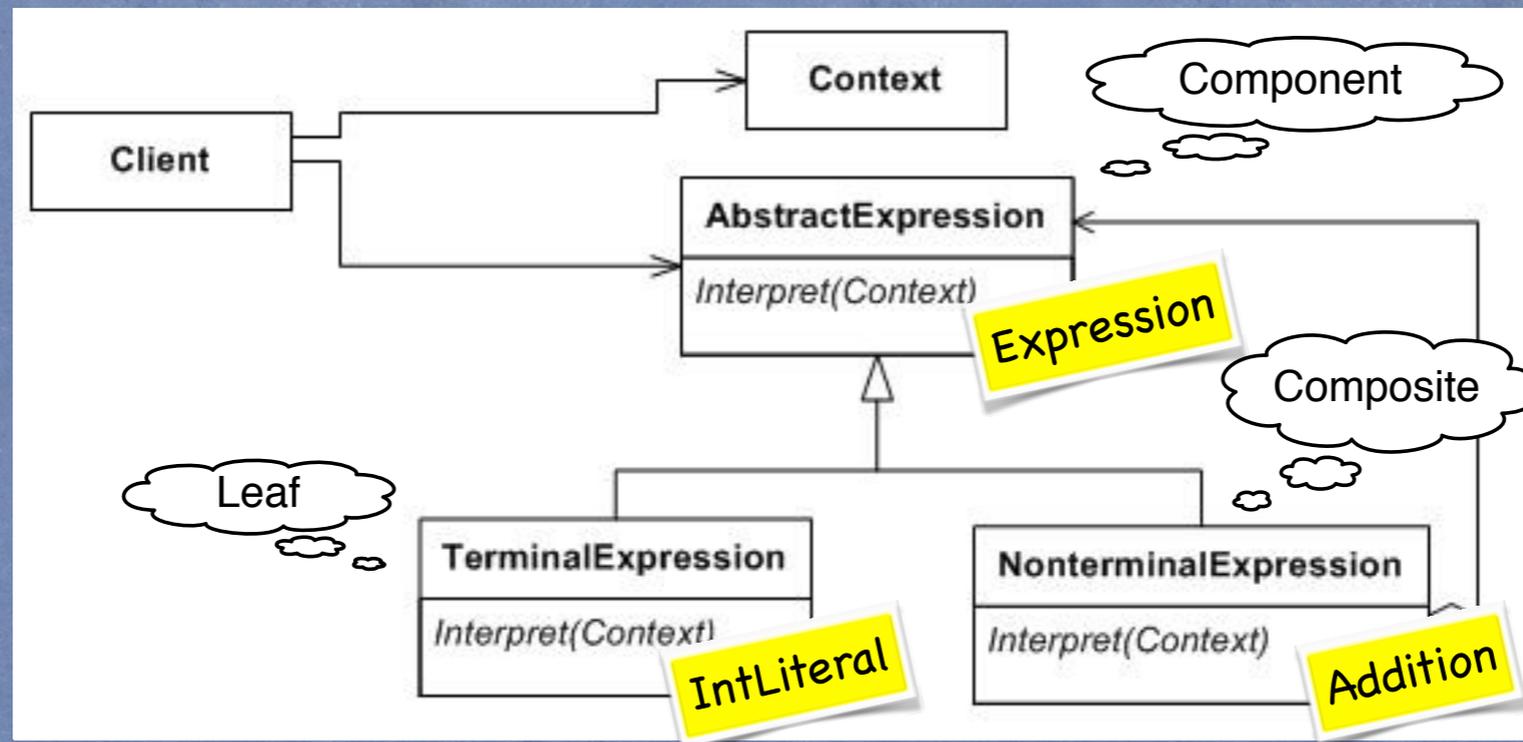

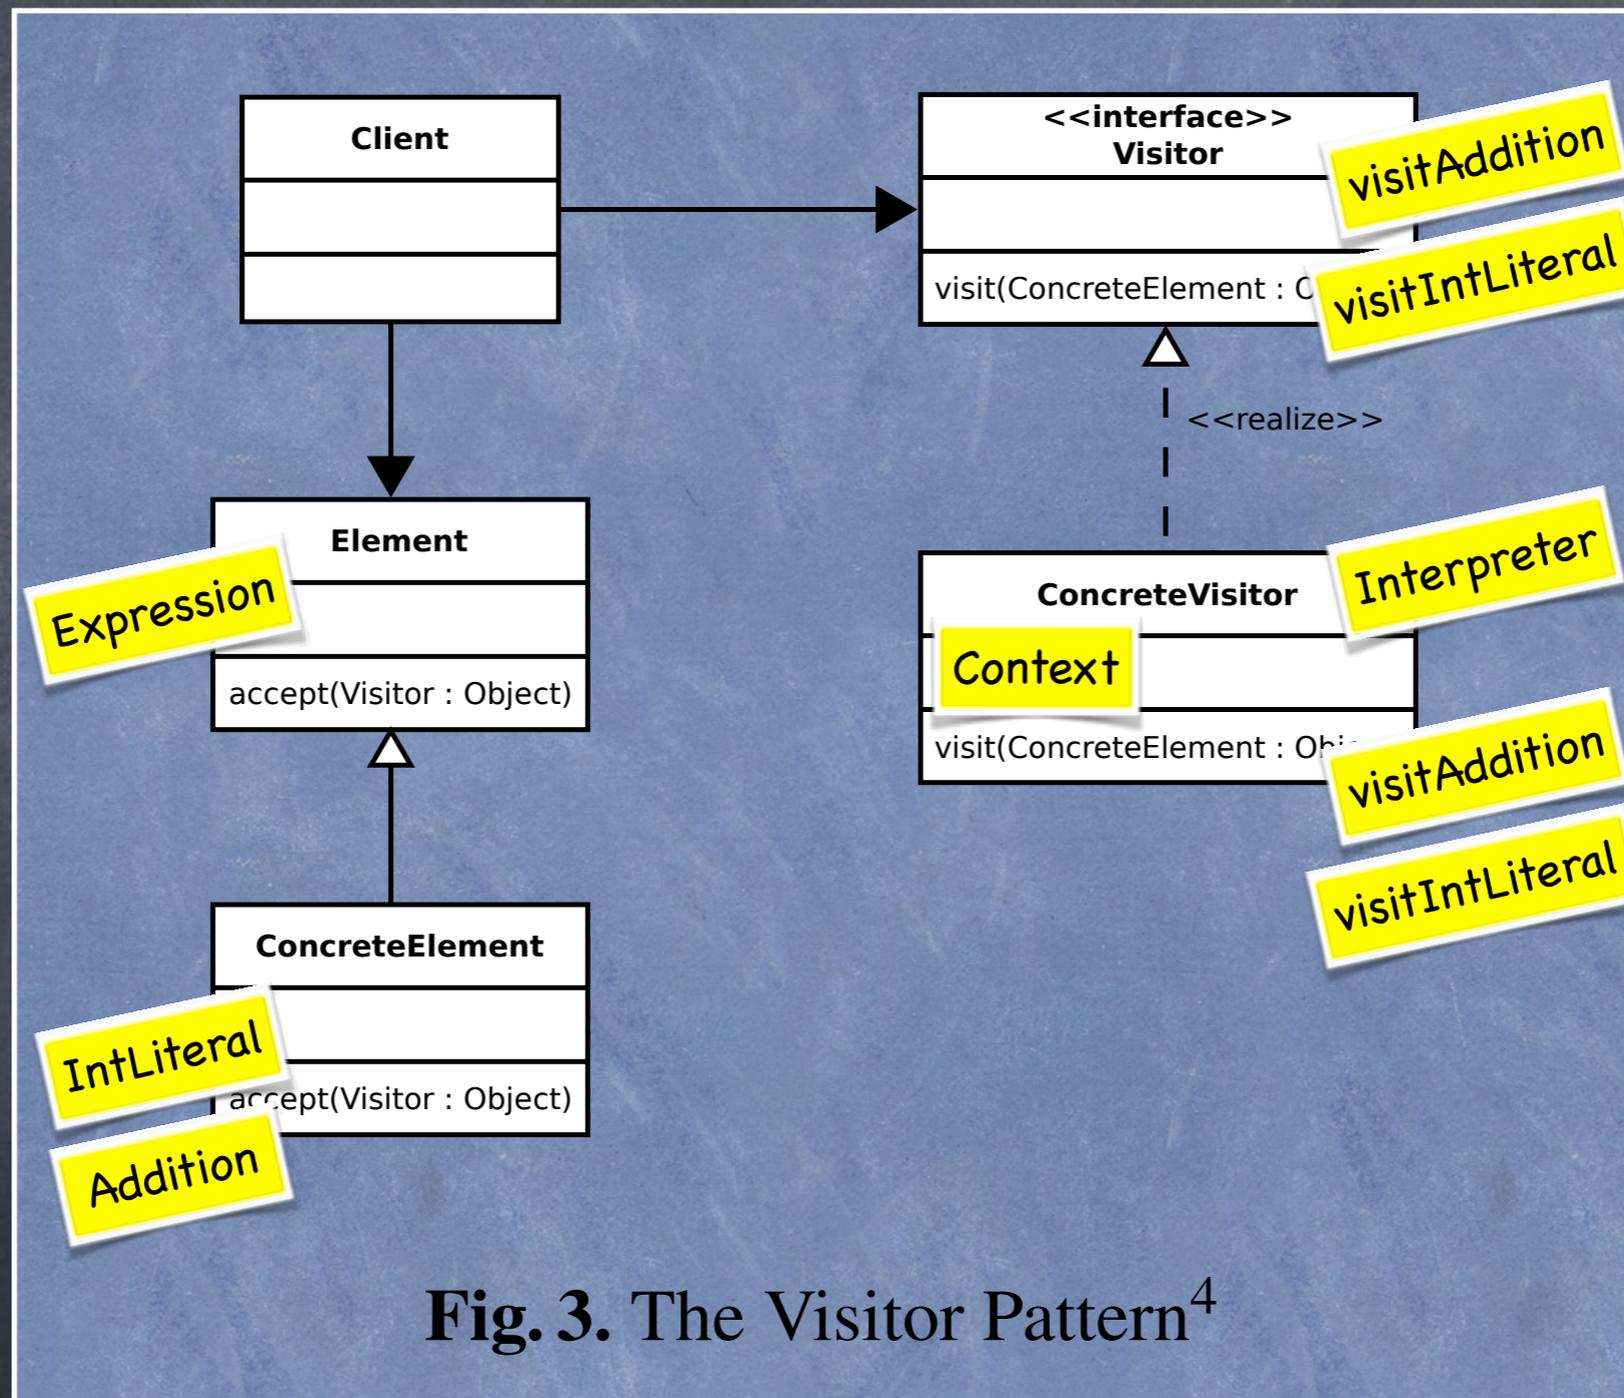

Fig. 4. The Interpreter Pattern with references to Composite (Figure 2).⁷

Visitor Pattern

Visitor design pattern and the Interpreter design pattern are functionally inter-changeable

But, they are different in non-functional properties

And, these emergent properties tend to be difficult to predict

Theoretical Observations

- Visitor is conceptually more complex

Harder to maintain, right?

- Interpreter is only a small extension of composite

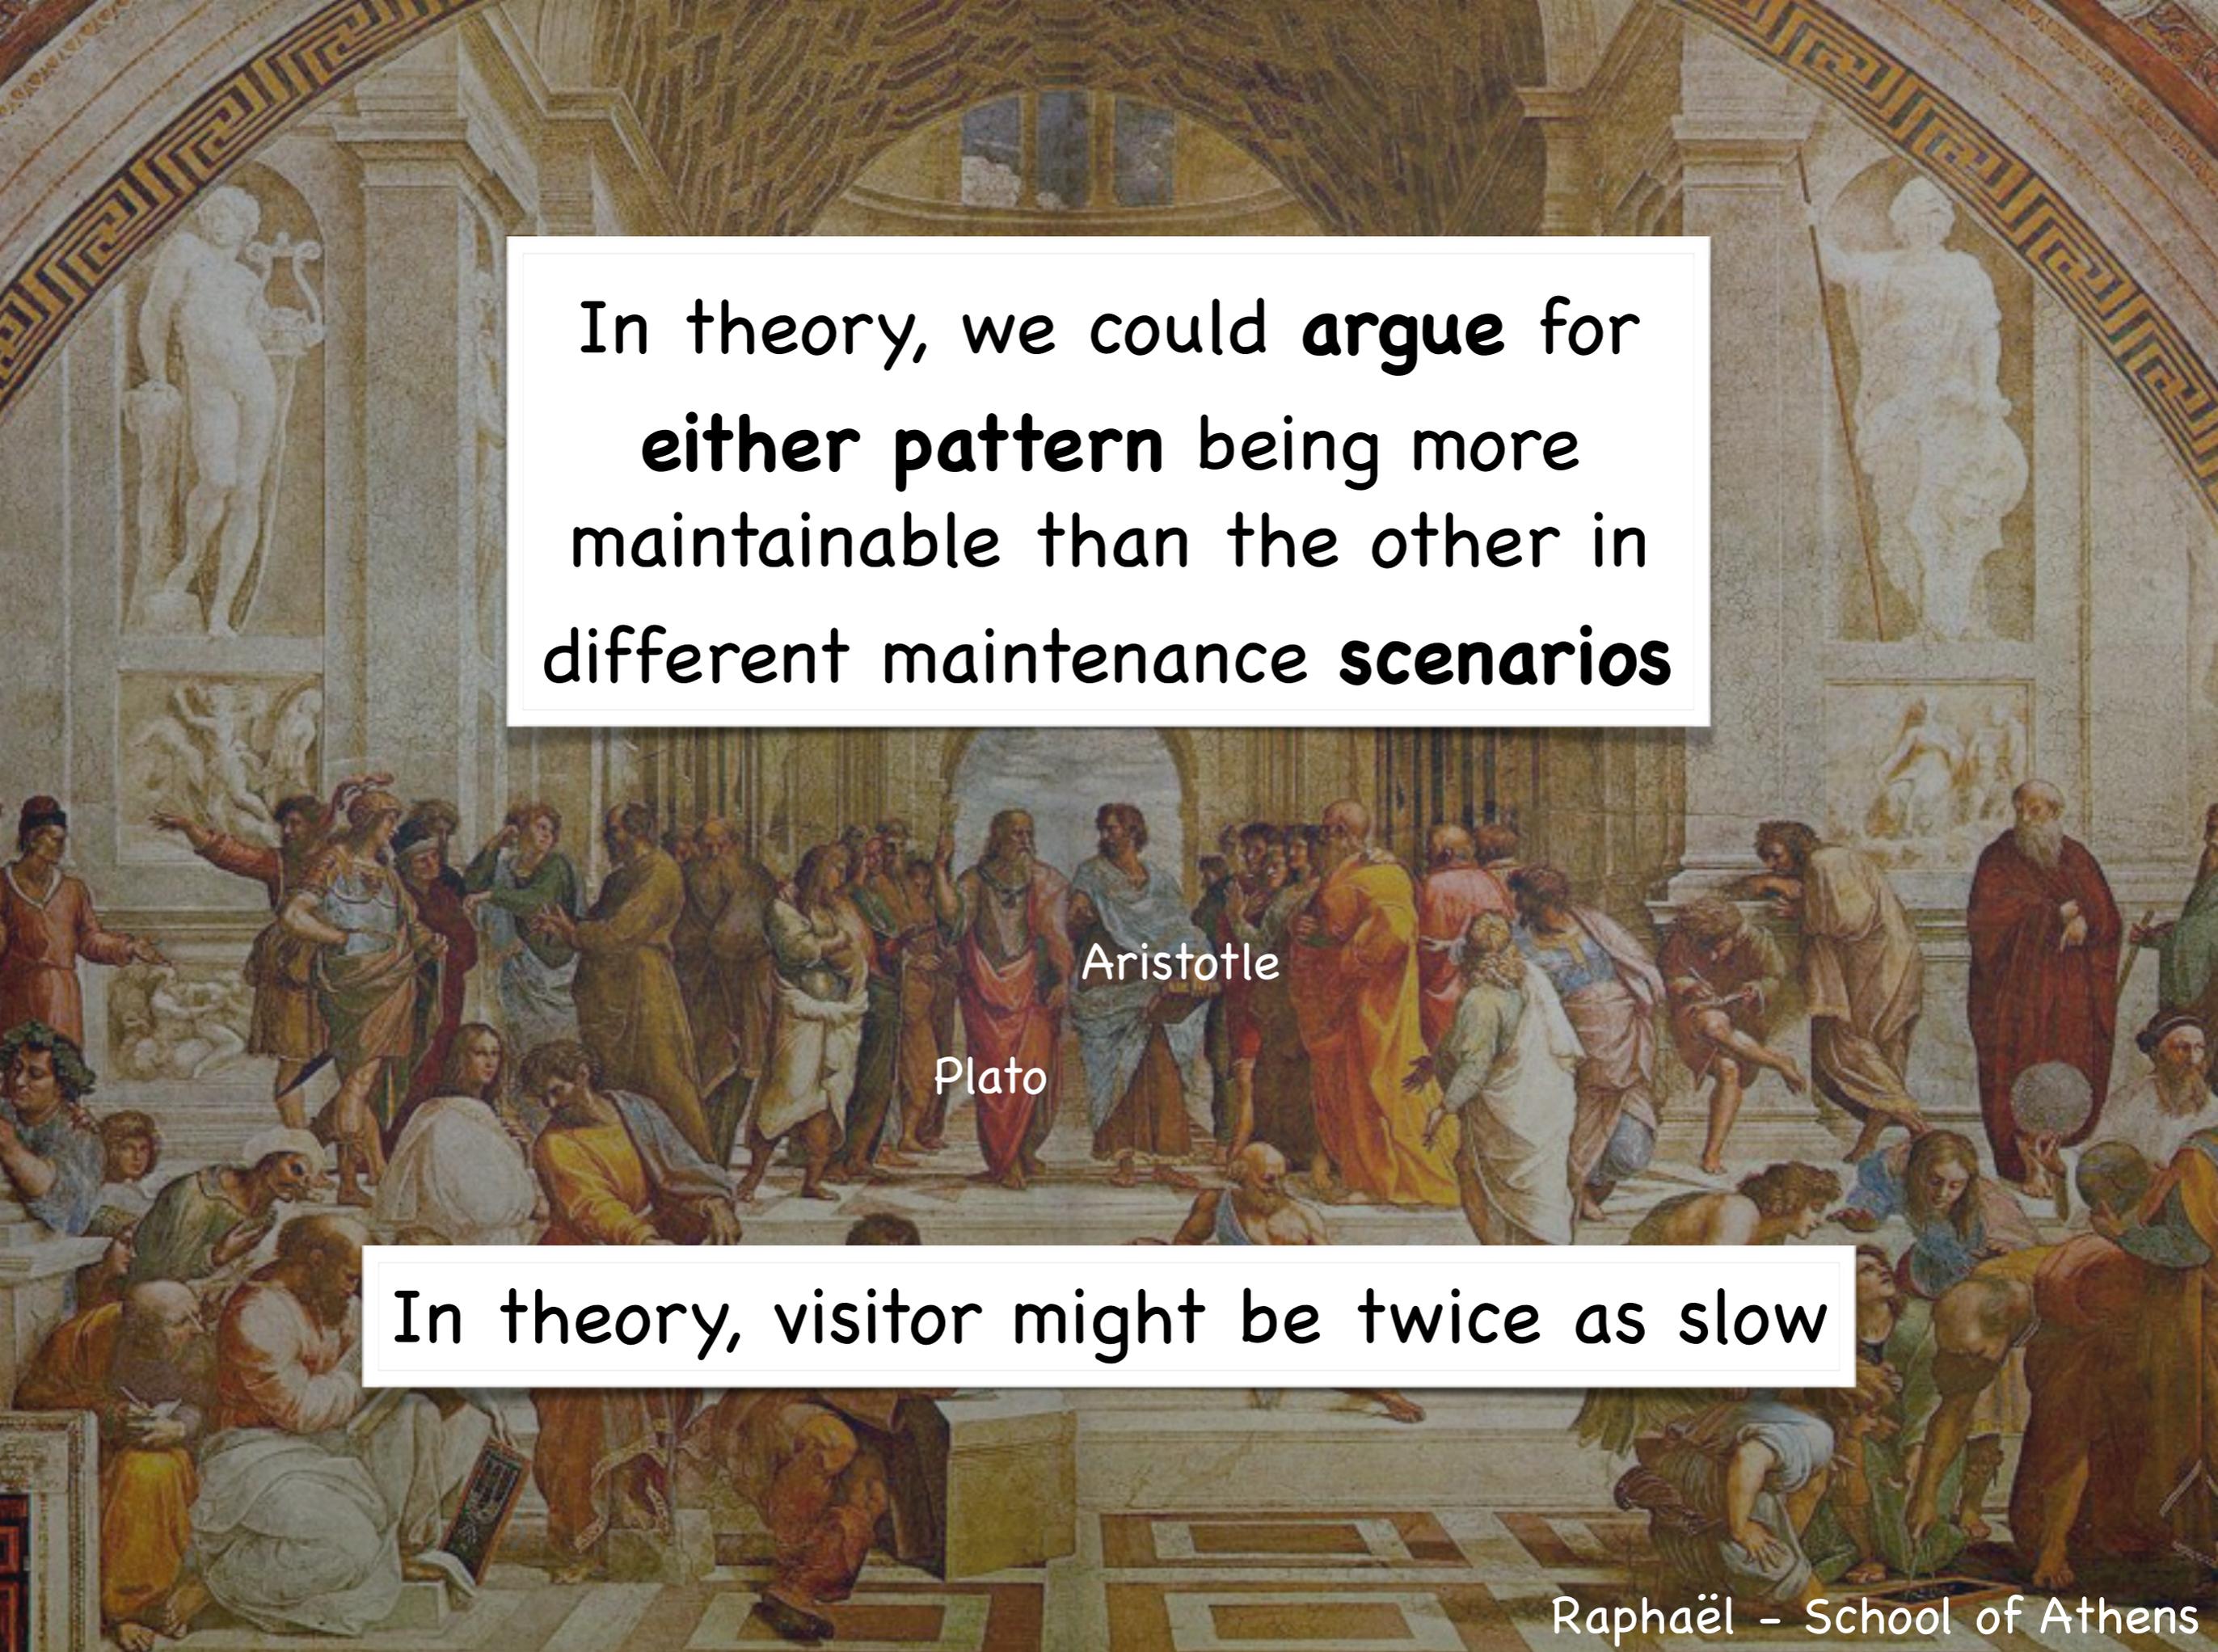

- Visitor encapsulates language constructs

Easy for adding algorithm, hard for adding new language construct, right?

- Interpreter encapsulates language constructs

- Visitor's dispatch is slower, right? dynamic indirection

- Interpreter has less dynamic dispatch

The background of the image is Raphael's fresco 'The School of Athens'. It depicts a group of ancient Greek philosophers in a grand, classical building. In the center, Plato and Aristotle are walking towards the viewer. Plato is on the left, pointing his right hand towards the sky, while Aristotle is on the right, gesturing downwards with his right hand. They are surrounded by other philosophers in various poses of discussion and study. The architecture features arches and classical columns.

In theory, we could **argue** for
either pattern being more
maintainable than the other in
different maintenance **scenarios**

Aristotle

Plato

In theory, visitor might be twice as slow

Empirical Observations

- Visitor-based interpreter is complex
- Many visitors classes
- Main interpreter is a "God class"
- Interpreter should run faster than this

Why this experiment?

- ④ Is the difference between Interpreter and Visitor **causing** a part of these two problems, or not at all?

- ④ How does one answer such a question?

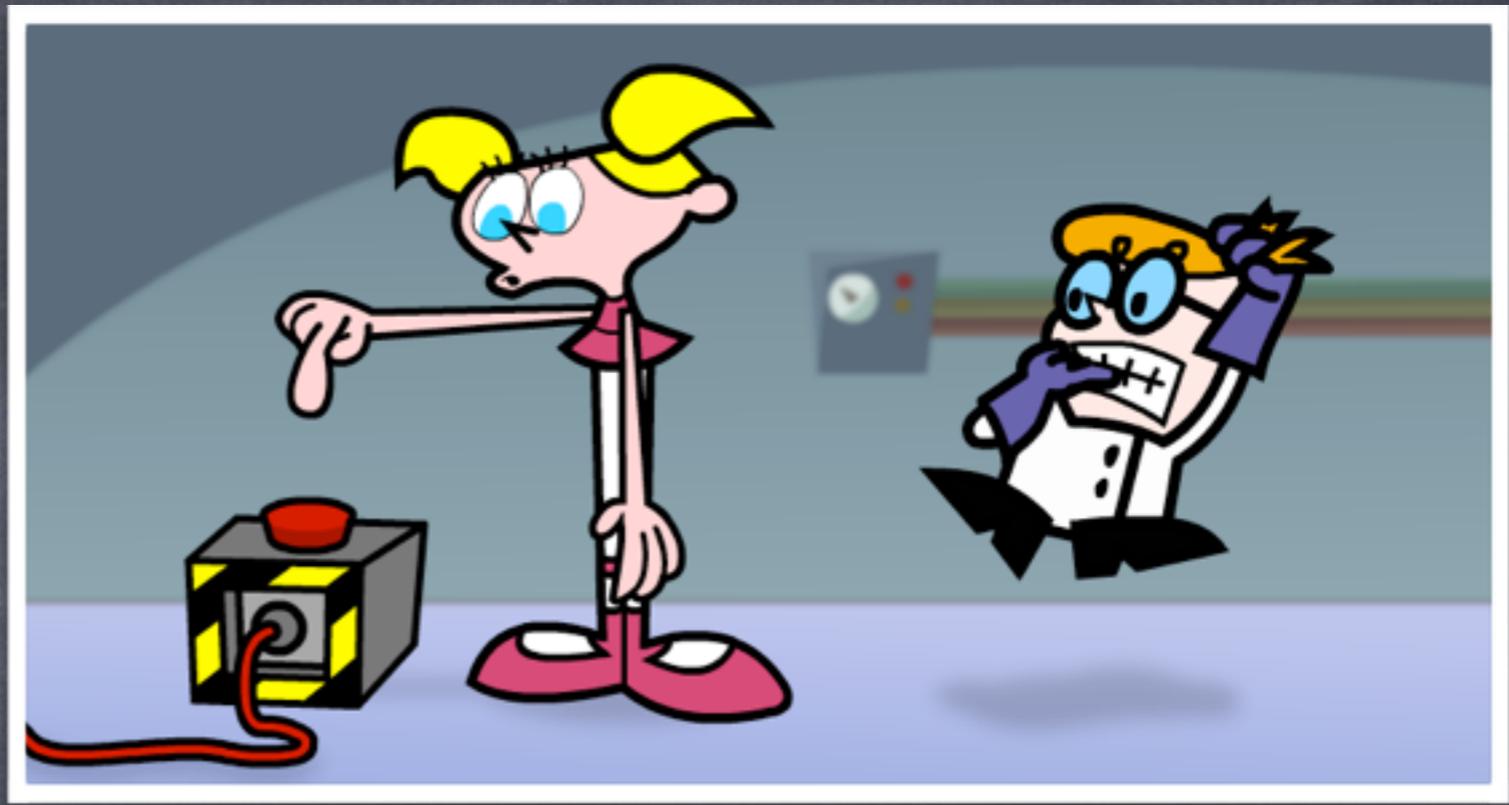

Why this lab setup?

Observing software “in the wild”

- In reality, there exist no two different versions of the same interpreter
- In reality, there are many other factors influencing maintenance and efficiency other than this design choice
- Reality is perhaps easy to see, but it is very hard to understand

Lab Experiment

- In a lab we may **isolate** a factor
- In the lab we may **focus** on the effect
- In the lab we can observe **causality** more directly

Possible lab experiments

- Source code metrics for maintainability
- Construction of Cognitive Models
- New method based on "Evolution complexity"

Source Code Metrics are (perhaps) good for observing reality statistically, but not for observing implications of design choices

Maintainability Index I&II

Maintenance Complexity Metric

SIG maintainability model

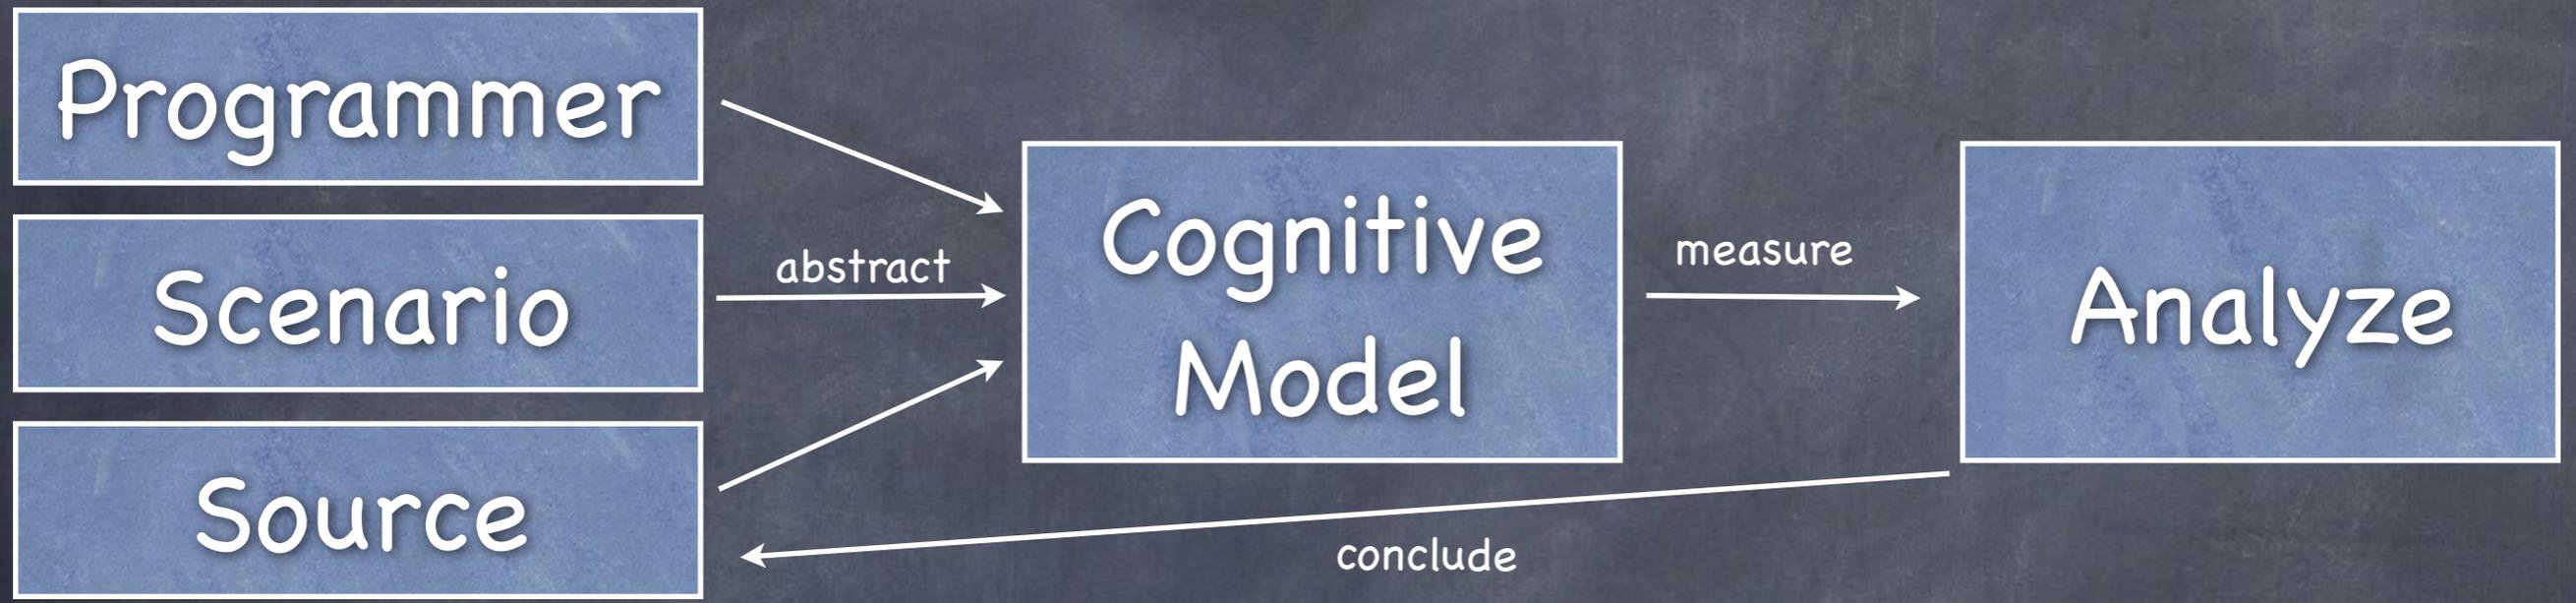

Computing and aggregating metrics values, independent of maintenance scenario, predicting long-term expectations on maintenance costs

If validated and calibrated these make sense on huge long-lived systems, but they say **nothing about the next maintenance scenario** applied to the system

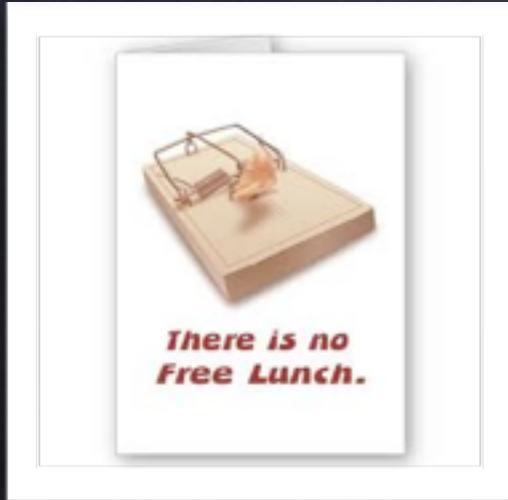

**The
Problem**

What about using **Cognitive Models** of understanding the source code then?

Unfortunately, we neither understand nor trust these models

IDE + source code + human => very complex models of cognition

Our Lab Setup

- Refactoring to get two versions
- Applying realistic maintenance scenarios
- Measuring the optimal “effort” of doing maintenance
- Analyzing differences by tracing back to code

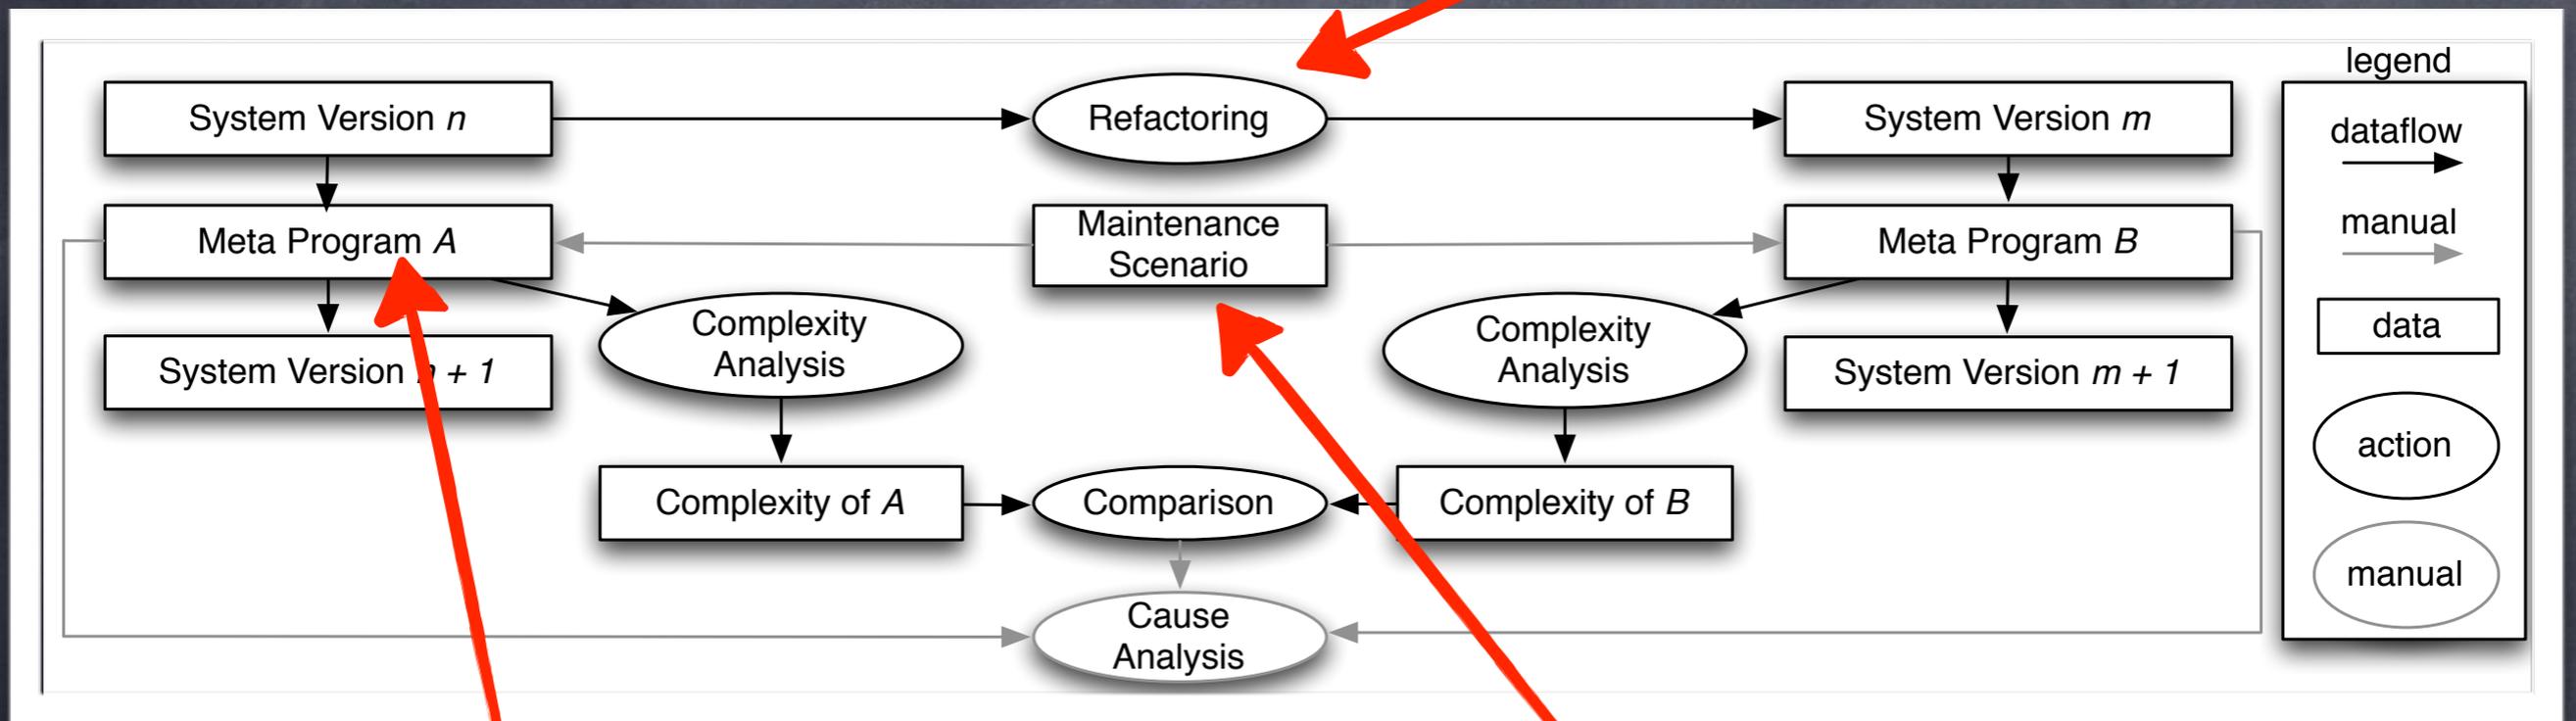

A "refactoring" is an automated source-to-source program transformation that **guarantees** run-time **semantics** to be preserved.

The application of a refactorings is intended to improve quality of source code without too much manual labor.

Refactorings are a way to mitigate complexity

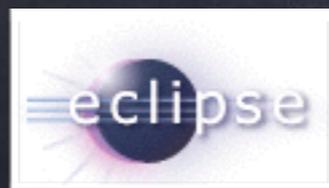

Isolating the variable

Key enabler

Traceability

Manual labor

Rascal & JDT to implement Visitor
to Interpreter refactoring

"Complexity of Maintenance"

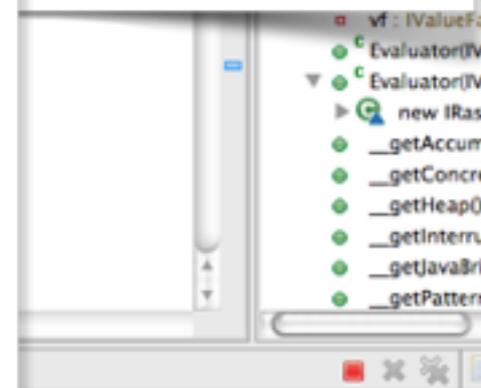

Precise definitions in [TOOLS2011]

- Maintainability = Understandability + Modifiability
- Complexity of a maintenance scenario is =
 - #steps to learn facts about a Program +
 - #steps to modify the Program
- Reify steps as a "Meta Program" that operates the IDE

Inspired by "Measuring Software Flexibility"
by Mens & Eden, IEE Software 2006

Results

S	Visitor	(COM)	Interpreter	(COM)	Vis.>Int.
S1	$ci^{11}(g^2a)^2$	(18)	$m^2b(ef^2)^3(ga)^2$	(16)	yes
S1(N)	$ci^{11}(g^Na)^2$	$(14 + 2N)$	$m^N h(ef^N)^3(ga)^N$	$(4 + 6N)$	if $N \leq 2$
S1'(N,2)	$ci^{11}(g^Na)^2$	$(14 + 2N)$	$m^N(ga)^N$	$(3N)$	if $N \leq 14$
S1'(N,M)	$ci^{11}(g^Na)^M$	$(10 + 14M + 2M)$	$m^N(ga)^{MN}$	$(14 + 2MN)$	if $N \leq \frac{2M+10}{M+1}$
S2	i^2g^3iga	(8)	$i^2g^3gaig^3aiga$	(14)	no
S3	$dg^5egcg^{15}g^2a(eea)^4i^2h(ga)^3$	(43)	$d(ig)^2a(iga)^{15}(ig)^3gai$ $(ig^2)a(igg)^2anigaih(ga)^3$	(83)	no
S3'	$d(ga)^5egac(ga)^{15}(ga)^2$ $(eea)^4i^2h(ga)^3$	(70)	$d(ig)^2a(iga)^{15}(ig)^3gai$ $(ig^2)a(igg)^2anigaih(ga)^3$	(83)	no
				(36)	no
				(3)	yes

steps to add N constructs to Visitor
 $14 + 2N$

steps to add N constructs to Interpreter
 $3N$

break-even at
 $N = 14$

Why trust this?

- **Construct validity:** are all aspects maintainability observable in this experiment?
- **Internal validity:** did you really do job possible in all scenarios?
- **External validity:** does this say anything about the next interpreter I write in Java? The next maintenance? What if I do an Eclipse? What if <blablabla>?

other factors may still dominate, but that is why we compare two equivalent systems

there is no proof of that - we invite you to reproduce or invalidate the results

we do **not** know

Summary of case

- We used Rascal to build a refactoring tool
- to isolate the difference between Visitor & Interpreter
- and using the "Complexity of Maintenance" method
- we found that Visitor is better*

*given the scope of the experiment

From threats to questions

- **Theoretical:** how to prove semantics preservation for these types of transformations for real programming languages?
- **Empirical:** how to validate that our maintainability complexity measure makes sense?

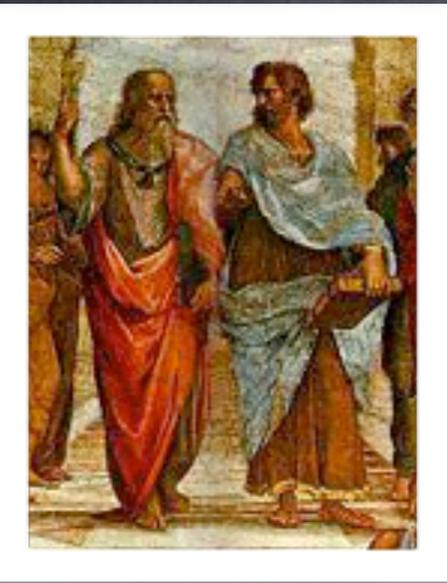

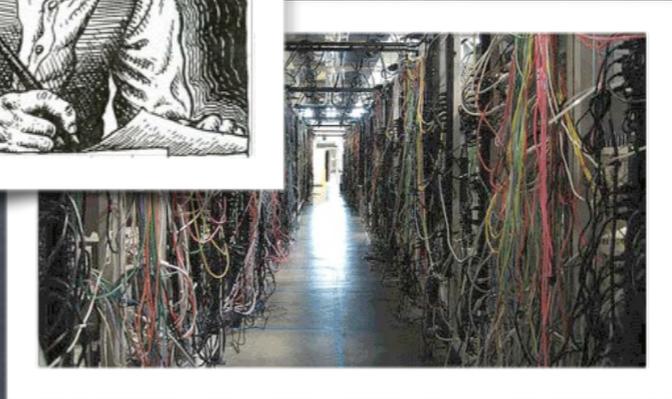

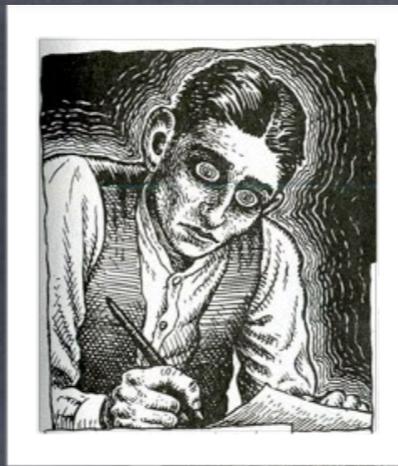

Semantics preserving

- Problems:
 - Programming languages are ridiculously complex
 - There are ridiculously many languages
- Possible answers:
 - Abstract semantics [Veerman (CFG), Vu (PGA)]
 - Formal specification of refactorings [Tip, DeMoor]

The future

- Do many more of such “isolation” experiments
 - Study theory of refactoring
 - Prototype relevant (lab) tools
 - Find out what matters in software engineering
- Cases: exceptions, parallelism, dynamic dispatch, immutability, ... ad infinitum

Questions?
