## Example: Letter Frequencies

| $i$ | $a_{i}$ | $p_{i}$ |  |
| :---: | :---: | :---: | :---: |
| 1 | a | 0.0575 | a |
| 2 | b | 0.0128 | b |
| 3 | c | 0.0263 | c |
| 4 | d | 0.0285 | d |
| 5 | e | 0.0913 | e |
| 6 | f | 0.0173 | f |
| 7 | g | 0.0133 | g |
| 8 | h | 0.0313 | h |
| 9 | i | 0.0599 | i |
| 10 | j | 0.0006 | j |
| 11 | k | 0.0084 | k |
| 12 | 1 | 0.0335 | 1 |
| 13 | m | 0.0235 | m |
| 14 | n | 0.0596 | n |
| 15 | $\bigcirc$ | 0.0689 | $\bigcirc$ |
| 16 | p | 0.0192 | p |
| 17 | q | 0.0008 | q |
| 18 | r | 0.0508 | r |
| 19 | s | 0.0567 | S |
| 20 | t | 0.0706 | t |
| 21 | u | 0.0334 | u |
| 22 | v | 0.0069 | v |
| 23 | W | 0.0119 | W |
| 24 | x | 0.0073 | x |
| 25 | y | 0.0164 | y |
| 26 | z | 0.0007 | z |
| 27 | - | 0.1928 | - |

Figure 2.1. Probability
distribution over the 27 outcomes for a randomly selected letter in an English language document (estimated from The Frequently Asked Questions Manual for Linux). The picture shows the probabilities by the areas of white squares.

## Example: Surprisal Values

from http://www.umsl.edu/~fraundorfp/egsurpri.html

| situation | probability $p=1 / 2^{\text {\#\#dits }}$ | surprisal \#bits $=\ln _{2}[1 / \mathrm{p}]$ |
| :---: | :---: | :---: |
| one equals one | 1 | 0 bits |
| wrong guess on a 4-choice question | 3/4 | $\ln _{2}[4 / 3] \sim 0.415$ bits |
| correct guess on true-false question | 1/2 | $\mathrm{ln}_{2}[2]=1 \mathrm{bit}$ |
| correct guess on a 4-choice question | 1/4 | $\mathrm{ln}_{2}[4]=2$ bits |
| seven on a pair of dice | $6 / 6^{2}=1 / 6$ | $\ln 2[6] \sim 2.58$ bits |
| snake-eyes on a pair of dice | $1 / 6^{2}=1 / 36$ | $\mathrm{In}_{2}[36] \sim 5.17$ bits |
| random character from the 8-bit ASCII set | 1/256 | $\ln 2\left[2^{8}\right]=8$ bits $=1$ byte |
| N heads on a toss of N coins | $1 / 2^{\mathrm{N}}$ | $\ln _{2}\left[2^{N}\right]=N$ bits |
| harm from a smallpox vaccination | $\sim 1 / 1,000,000$ | $\sim \ln _{2}\left[10^{6}\right] \sim 19.9$ bits |
| win the UK Jackpot lottery | 1/13,983,816 | $\sim 23.6$ bits |
| RGB monitor choice of one pixel's color | $1 / 256^{3} \sim 5.9 \times 10^{-8}$ | $\ln _{2}\left[2^{8 * 3}\right]=24$ bits |
| gamma ray burst mass extinction event TODAY! | $<1 /\left(10^{9 * 365) ~} \sim 2.7 \times 10^{-12}\right.$ | hopefully > 38 bits |
| availability to reset 1 gigabyte of random access memory | $1 / 2^{8 \mathrm{E} 9} \sim 10^{-2.4 \mathrm{E} 9}$ | $8 \times 10^{9}$ bits $\sim 7.6 \times 10^{-14} \mathrm{~J} / \mathrm{K}$ |
| choices for $6 \times 10^{23}$ Argon atoms in a 24.2 L box at 295 K | $\sim 1 / 2^{1.61 \mathrm{E} 25} \sim 10^{-4.8 \mathrm{E} 24}$ | $\sim 1.61 \times 10^{25}$ bits $\sim 155 \mathrm{~J} / \mathrm{K}$ |
| one equals two | 0 | $\infty$ bits |

| $i$ | $a_{i}$ | $p_{i}$ | $h\left(p_{i}\right)$ |
| :---: | :---: | :---: | ---: |
| 1 | a | .0575 | 4.1 |
| 2 | b | .0128 | 6.3 |
| 3 | c | .0263 | 5.2 |
| 4 | d | .0285 | 5.1 |

## Examples: Convex \& Concave Functions

## Jensen's Inequality

Definition 1 The function $f: \mathcal{D} \rightarrow \mathbb{R}$ is convex if for all $x_{1}, x_{2} \in \mathcal{D}$ and for all $\lambda \in[0,1] \subset \mathbb{R}$ :

$$
\lambda f\left(x_{1}\right)+(1-\lambda) f\left(x_{2}\right) \geq f\left(\lambda x_{1}+(1-\lambda) x_{2}\right) .
$$

The function $f$ is strictly convex if equality only holds when $\lambda=0$ or $\lambda=1$, or when $x_{1}=x_{2}$. The function $f$ is (strictly) concave if the function $-f$ is (strictly) convex.

Proposition 2 (Jensen's inequality) Let the function $f: \mathcal{D} \rightarrow \mathbb{R}$ be convex, and let $n \in \mathbb{N}$. Then for any $p_{1}, \ldots, p_{n} \in \mathbb{R}_{\geq 0}$ such that $\sum_{i=1}^{n} p_{i}=1$ and for any $x_{1}, \ldots, x_{n} \in \mathcal{D}$ it holds that

$$
\sum_{i=1}^{n} p_{i} f\left(x_{i}\right) \geq f\left(\sum_{i=1}^{n} p_{i} x_{i}\right) .
$$

If $f$ is strictly convex and $p_{1}, \ldots, p_{n}>0$, then equality holds iff $x_{1}=\cdots=x_{n}$.
In particular, if $X$ is a real random variable whose image $\mathcal{X}$ is contained in $\mathcal{D}$, then

$$
E[f(X)] \geq f(E[X])
$$

and, if $f$ is strictly convex, equality holds iff there is $c \in \mathcal{X}$ such that $X=c$ with probability 1.

## Binary Entropy Function

Figure 1.3. The binary entropy function.

## Decomposability of Entropy

$$
\begin{equation*}
H(\mathbf{p})=H\left(p_{1}, 1-p_{1}\right)+\left(1-p_{1}\right) H\left(\frac{p_{2}}{1-p_{1}}, \frac{p_{3}}{1-p_{1}}, \ldots, \frac{p_{I}}{1-p_{1}}\right) \tag{2.43}
\end{equation*}
$$

When it's written as a formula, this property looks regrettably ugly; nevertheless it is a simple property and one that you should make use of.

Generalizing further, the entropy has the property for any $m$ that

$$
\begin{align*}
H(\mathbf{p})= & H\left[\left(p_{1}+p_{2}+\cdots+p_{m}\right),\left(p_{m+1}+p_{m+2}+\cdots+p_{I}\right)\right] \\
& +\left(p_{1}+\cdots+p_{m}\right) H\left(\frac{p_{1}}{\left(p_{1}+\cdots+p_{m}\right)}, \ldots, \frac{p_{m}}{\left(p_{1}+\cdots+p_{m}\right)}\right) \\
& +\left(p_{m+1}+\cdots+p_{I}\right) H\left(\frac{p_{m+1}}{\left(p_{m+1}+\cdots+p_{I}\right)}, \cdots, \frac{p_{I}}{\left(p_{m+1}+\cdots+p_{I}\right)}\right) . \tag{2.44}
\end{align*}
$$

## Mutual Information and Entropy

Theorem: Relationship between mutual information and entropy.

$$
\begin{aligned}
I(X ; Y) & =H(X)-H(X \mid Y) \\
I(X ; Y) & =H(Y)-H(Y \mid X) \\
I(X ; Y) & =H(X)+H(Y)-H(X, Y) \\
I(X ; Y) & =I(Y ; X) \quad \text { (symmetry) } \\
I(X ; X) & =H(X) \quad \text { ("self-information") }
\end{aligned}
$$

ECE 534 by Natasha Devroye

## Chain Rule for Entropy

Theorem: (Chain rule for entropy): $\left(X_{1}, X_{2}, \ldots, X_{n}\right) \sim p\left(x_{1}, x_{2}, \ldots, x_{n}\right)$

$$
H\left(X_{1}, X_{2}, \ldots, X_{n}\right)=\sum_{i=1}^{n} H\left(X_{i} \mid X_{i-1}, \ldots, X_{1}\right)
$$

ECE 534 by Natasha Devroye

## Chain Rule for Mutual Information

Theorem: (Chain rule for mutual information)

$$
I\left(X_{1}, X_{2}, \ldots, X_{n} ; Y\right)=\sum_{i=1}^{n} I\left(X_{i} ; Y \mid X_{i-1}, X_{i-2}, \ldots, X_{1}\right)
$$
